Question 1. (Single Select)

Which of the following is a prioritized list of the requirements for a product?

A: Project canvas
B: Release map
C: Project log
D: Backlog

Answer: D

Explanation:
In PRINCE2 Agile, a Backlog is the prioritized list of requirements, features, or user stories that define what needs to be delivered for a product. It is a dynamic and evolving list that is continually refined and re-prioritized to ensure the most valuable work is done first. The backlog acts as a single source of truth for what the team needs to deliver and provides transparency to stakeholders regarding progress and priorities. It aligns with agile principles and practices such as Scrum, where the Product Backlog contains all desired work for the product.
The Project Canvas is a high-level tool used for defining project scope and objectives, the Release Map plans releases and iterations, and the Project Log tracks issues, risks, and actions but does not list prioritized requirements.

Question 2. (Single Select)

What role does AI play in addressing project complexity within PRINCE2 Agile?

A: It helps reduce all sources of project complexity
B: It adds layers of complexity through excessive automation
C: It helps reduce uncertainty and ambiguity associated with change initiatives
D: It ensures stakeholder involvement in all decision-making

Answer: C

Explanation:
Artificial Intelligence (AI) in PRINCE2 Agile is recognized as a tool that can assist in reducing uncertainty and ambiguity by providing data-driven insights, predictive analytics, and automation of routine tasks. This support helps teams better understand changing environments and respond faster, thereby addressing complexity associated with change initiatives.
While AI can add complexity if misused, PRINCE2 Agile focuses on its beneficial role in supporting decision-making and reducing unknowns rather than complicating governance or communication.

Question 3. (Single Select)

Which organizational level is responsible for day-to-day management and decision making within the constraints established by the project manager?

A: Commissioning
B: Directing
C: Managing
D: Delivering

Answer: D

Explanation:
The Delivering level is responsible for the day-to-day management and decision-making within the constraints set by the project manager. Delivering teams carry out the actual work to create the project products and manage their activities under the project's governance framework. The Project Manager manages the overall project, while directing sets the strategic direction and commissioning authorizes initiation.
This separation ensures clear responsibilities and empowers the delivery teams to self-manage within defined boundaries.

Question 4. (Single Select)

What is a good criterion to include in the Definition of Ready?

A: The product is ready to hand over
B: All components are complete

C: Acceptance criteria are measurable

D: The product has passed the quality checks

Answer: C

Explanation:

A key criterion for the Definition of Ready is that acceptance criteria are measurable. This ensures that work items are clearly understood, well-defined, and have objective criteria to confirm when they are complete. Measurable acceptance criteria reduce ambiguity and support efficient development and quality assurance.

Other options describe completion or handover stages, which are more relevant to the Definition of Done, not Ready.

Question 5. (Single Select)

Which of the following is a benefit of an organization being and doing agile?

A: Faster time-to-market

B: Using agile techniques

C: Focusing on completing tasks

D: Setting all tolerances to zero

Answer: A

Explanation:

A primary benefit of an organization being and doing agile is faster time-to-market. Agile methods emphasize iterative delivery, frequent releases, and continuous feedback, enabling organizations to deliver value sooner and adapt quickly to changes. This benefit directly supports business agility and competitive advantage.

Using agile techniques alone (B) is a means, not a benefit. Focusing solely on tasks (C) ignores value and flow, and setting tolerances to zero (D) is neither practical nor encouraged.
